Supplementary Figure 1. Association of rs34037914 genotypes with disease characteristics in the group of acromegaly patients. (A) and (B) represent mean values of BMI and age of onset respectively for each genotype. Error bars represent standard deviation. P values are obtained from ANOVA test. (C) represents distribution of genotypes between groups of patients with reduced or unchanged size of adenoma as a result of medical therapy. (D) represents distribution of genotypes in groups of patients with different number of adenoma resection surgeries. Number of patients in each genotype group is shown by numbers above bars in C and D.
