Supplementary figure 1 Longitudinal serum levels of adrenal androgens; DHEAS (A) and Δ4-Androstenedione (Adione) (B), BM (C), sum of four skin folds (D), height (E) and height velocity (F) according to age in healthy girls. The 42 out of 89 girls whose onset of breast development could be tracked were divided into quartiles according to their age at B2+: The girls with earliest age at B2+ (the 1st quartile) are illustrated with red lines, the 2nd and 3rd quartile with grey lines and the 4th quartile with black lines. Each line represents a child.
