Supplemental Figure 1 Covariation of serum Klotho, IGF-1 and GH depicted for the 12 acromegaly patients in Figure 1. Serum values are high preoperatively (filled squares) and decrease after surgery (2-3 months postOP, open circles) in all patients. The covariation of serum Klotho and IGF-1 as well as the covariation of serum Klotho and GH are highly significant (both, $P<0.001$, sign test).
