Supplemental Figure 4 – Serum GH and IGF-I levels at the last visit. Panel A shows hormone concentrations in 633 patients with available mean GH and IGF-I values at the last visit. The horizontal and vertical lines delineate four groups of patients according to their mean GH (< or >1 ng/mL) and IGF-I concentrations (< or > the upper limit of normal – ULN); panel B shows nadir GH and IGF-I concentrations in 261 patients with available data. The horizontal and vertical lines delineate four groups of patients according to their mean GH (< or > 0.4 ng/mL) and IGF-I concentrations (see above).
